

Kishore Sudhamalla

Product Designer · Complex Enterprise Systems · AI & Agentic Experiences

I design complex enterprise products and build what I design. Sixteen years of making difficult systems usable, nine of them on a global HR platform, which is where I learned to work with years of accumulated history, many user roles, and business rules most people never see. That same systems thinking is now going into AI and agentic experiences: what the system decides, what it suggests, and what stays with a person.

EXPERIENCE

Darwinbox 2017 – PRESENT Global HCM platform	Associate Director, UX Leading AI-native and agentic experience design across the platform, defining where AI should act on someone's behalf, where it should assist, and where humans need to remain in control. Designing the behaviours, interactions and guardrails around autonomy, permissions, explainability, trust, failure and recovery. Setting design direction across six product areas: Time Management, Core, Payroll, Benefits, Extensibility, and Workflows & Journeys, while staying hands-on with the hardest product problems and shaping how an enterprise HR platform evolves toward AI-native experiences. Lead and mentor designers across multiple product areas while partnering with product and engineering leaders to shape product direction, resolve difficult product problems and raise design quality across teams.
2021 – 2024	Senior UX Manager Rebuilt Time Management, an eight-year-old enterprise module that had become increasingly difficult to use as Darwinbox expanded across customers and markets. Reorganised the experience around what managers need to understand and decide first, rather than exposing the complexity of the underlying product structure. Worked through complex workforce rules, configurations, permissions and global requirements to create a clearer experience for different customer contexts. Validated the new model with 8 enterprise clients across Southeast Asia before global rollout. The work contributed to the evolution of Darwinbox's Workforce Management product, which moved from 2.9 → 3.5 in the Gartner Magic Quadrant for Workforce Management by 2025.
2017 – 2021	UX Manager · Senior Product Designer Joined Darwinbox as an early founding member of the design team and helped establish the foundations for product design as the company scaled rapidly. Built the initial design language and style guide, introduced reusable patterns and established a design review practice that helped the team maintain product quality without losing the speed a startup needs. Led the design of Workflows & Journeys, a platform layer connecting HR events such as onboarding, transfers, promotions and exits to the systems that execute them across country rules, business logic and role permissions. Designed for complex enterprise scenarios spanning multiple products, user roles and dependencies, and shipped the experience across 120+ countries. Worked closely with product and engineering to turn a complex platform model into a framework organisations could use to create and manage employee journeys. This period covered Darwinbox's evolution from an early-stage startup into a unicorn, while the product, customer base and design organisation grew significantly alongside

the business.

WTA Studios 2015 – 2017	Product Designer End-to-end design for web and mobile products. Introduced design thinking to cross-functional teams and began mentoring junior designers.
Earlier roles 2009 – 2015	UI/UX · Visual · Graphic Designer Wave Crest Group (enterprise dashboards), Green Gold Animation (Chhota Bheem franchise), Anil Bhanu Core Design. Six years across every medium before specialising in product.

DESIGNED AND BUILT SOLO

Design Ops 2026 Side project · in daily use	A delivery system for a design org, design through to working product Jira reported tickets, not whether a team was on pace. I designed and built a tool that syncs a live Jira board and reports delivery, capacity and slipped commitments, vanilla JavaScript, no framework, written in Claude Code. In daily use. Then added the layer I actually wanted to design: an AI that explains <i>why</i> a commitment slipped, cites the changelog entries and comments it read, proposes one action, and only writes to Jira after a person approves the exact record. It measures whether the intervention held, and reports its own recommendations when they failed.

SKILLS

COMPLEX SYSTEMS

Enterprise UX · systems thinking · platform design · workflows & journeys · multi-role permissions · global rollouts

AI & AGENTIC UX

Human–AI responsibility models · explainability and evidence · confidence and uncertainty · human-in-the-loop approval · failure and recovery

RESEARCH & DIRECTION

Jobs to Be Done · card sorting · enterprise client validation · design sprints · stakeholder alignment

PROTOTYPING & BUILDING

Claude Code · Figma · Figma MCP · Adobe CC

EDUCATION & CERTIFICATIONS

ISBM

Bachelor's in Visual Communications

XPERIAN · IBM

Digital Product Design · Enterprise Design Thinking · Essentials for AI

RECOGNITION

Darwinbox named Gartner Challenger 2024 (WFM), following the Time Management redesign · Presented at the SEA UX Roadshow across Singapore, the Philippines & Thailand

I've always learned by making, a product concept, a visual experiment, an AI prototype, or a new tool I'm trying to understand. Always open to conversations about complex products, enterprise systems, and AI-driven product experiences.
